

ABSTRACT

5 The invention concerns a method of broadcasting
data files, in particular multimedia files, during a
video conference using a sending terminal and a
man/machine interface located in the said terminal.
According to the method proposed, the broadcasting of
the files is effected in real time with a current video
10 conference communication, without breaking this
communication, using the audio and video channels open
for this communication, a participant being able, using
the said terminal, by means of a simple selection of
the file appearing on his screen and movement of this,
15 to activate the launch of the broadcasting of the file
to be broadcast.
